

Design Scheme

Scheme 1

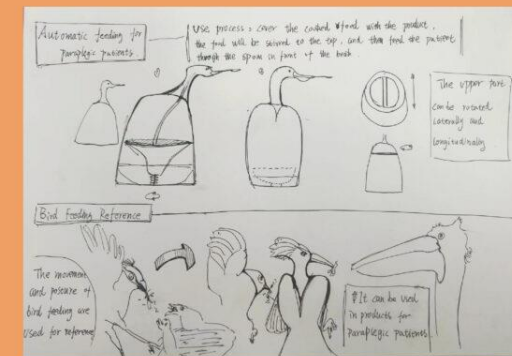

This is a creative shoe with a long zipper on the back and front, which can easily be worn by patients who are paralyzed from the waist down. For paraplegic patients with foot drop, the feet can be easily as simple as wearing shoe covers. At the same time, the insole in the middle of the foot is added with Chinese acupuncture point massage, and the side of the shoe is equipped with heating pad, which can well promote the blood circulation of the lower limbs of paraplegic patients, and is conducive to the health of the patients

This is a wearable device that captures muscle bioelectrical signals to identify the actions the user wants to complete, so as to help paraplegics to move, squat and other movements. The product adopts a lightweight design and is easy to wear. The power system of the product is a battery pack worn on the waist, which is easy to replace.

Scheme 2

The automated feeder mimics the movements and gestures of birds in the hope that it will also be used to feed paraplegics. The product is covered with cooked food, which is stirred to the top and fed to the patient using a spoon on the bird's mouth. The top of the product can rotate horizontally, at a small amplitude of longitudinal rotation, to meet the details of the feeding action

Feedback Scheme

After we discussion of each of your concepts, we have sorted out the advantages of each of your designs. Each of your design concepts are on point and interesting. To moving forward, we decided which of our injured clients benefits the most and potential future development products. What we want you to deduce from your design is as follows.

- We think that a wearable device is more suitable and on point with our brief. And we think it helps the injured people in their daily lives (walking, cooking, sports, etc.).
- The material and ingredients must be safe for the skin and the environment (sensitive to the skin).
- As we see through your design, is there any protection that covers the feet to the ankle?
- In order for the client to walk comfortably without feeling the product's weight around their legs, the product should be relatively lightweight. And you need to focusing on the specific components and ingredients that give the product lightweight.
- Because our target audience is younger generations, it could be more colourful and have different variations.

Q & A

- As we discussed, we wondered: do you have any opportunity to design your prototype in a practical way or in a digital format such as a 3D model? We would like to know how you reflect on your module for this project. I'd love to hear your plan and responds !
Thank you.
