

the product
should have
both water and
food
compartments.

not only one animal
should be fed with
this product, this is
why we want you to
make the product
to carry around 2L

overall
1.5Lt=food
capacity
0.5lt=water
capacity

The water capacity may
not look like enough, but
this is because it is easy
for people to refill the
water from nearby
markets if there is no
water left.

The stray cats have trouble
finding **good quality food**. This
is why the food part is bigger.
Animals can find water easily
from different places, but
finding food is harder.
The main point about the water
container is to **keep it clean**.
The people who feed the cats
have no problem finding water
for them.

The design must focus on
ease of carrying, the
appropriate capacity for
the target number of
animals to be fed, and the
details of a watertight
sealing system to ensure
safer transportation.

overall cleaning,
carrying this
product is
important.
Consider elderly
people's ability to
carry.
